-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 01 September 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-23 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-23 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

This Office Action is sent in response to Applicant's Communication received September 1, 2006 for application number 10/606,462 originally filed June 26, 2003. The Office hereby  
5 acknowledges receipt of the following and placed of record in file: claims 1-23 are presented for examination.

### *Claim Objections*

Applicant's arguments in response to claim objection for use of trademark INTEL ("IA-  
10 64" in claims 14 and 22) from Office Action dated June 1, 2006 is persuasive. Therefore, the claim objection has been overcome.

### *Claim Rejections - 35 USC § 102*

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the  
15 basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

20 Claims 15-20 and 23 are rejected under 35 U.S.C. 102(b) as being anticipated by Walton et al. (U.S. Patent No. 7,103,639 B2) (hereinafter referred to as Walton).

As to claim 15, Walton discloses a partition of multiple partition computer system comprising: a plurality of processors (CPUs 302); firmware (PDH) comprising a reset code that resets a portion (cell) of the partition, wherein one processor of the plurality of processors

Art Unit: 2116

(“monarch” processor) executes the reset code (Walton discloses the “monarch” processor within a cell managing booting and processor formation wherein PDH is a firmware device comprising booting code which is inclusive of initialization and reset; column 3, lines 5-12 and column 5, lines 35-47); and random access memory (cache within CM 304) that is not affected by the reset code, that stores a list of addresses associated with the portion (Walton discloses a complex profile being created which is a “map” of the cell configuration which comprises location of devices assigned to a cell/partition which inherently would contain processor locations [addresses] and therefore register addresses; column 2, lines 7-15 and column 4, line 47 thru column 5, line 34).

As to claim 16, Walton further discloses the partition of claim 15, further comprising: read only memory that stores the firmware (column 3, lines 5-12).

As to claim 17, Walton further discloses the partition of claim 15, further comprising: a plurality of cells (see Fig. 1); wherein each cell comprises at least one processor of the plurality of processors (CPUs 302), and each cell comprises a reset register (state register) having an address that is on the list (column 5, line 55 thru column 6, line 20).

As to claims 18-20, they are directed to the partition of steps set forth in claim 17. Therefore, they are rejected for the same basis as set forth hereinabove.

As to claim 23, Walton disclose a computer readable medium having computer program logic recorded thereon for operating a partition of a multiple partition computer system, wherein the partition comprises a plurality of processors (CPUS 301), the computer program logic comprising: means for (101) building a list (data structure called complex profile) of reset register addresses associated with the plurality of processors (Walton discloses a complex profile

Art Unit: 2116

being created which is a "map" of the cell configuration which comprises location of devices assigned to a cell/partition which inherently would contain processor locations [addresses] and therefore register addresses; column 2, lines 7-15 and column 4, line 47 thru column 5, line 34); means for (state registers via CM 304) placing each processor of the plurality of processors into a known state (column 4, lines 47-63 and column 5, line 55 thru column 6, line 6); and, means for (CM 304) resetting the plurality of processors by writing a reset code (B1B) into their associated reset registers (column 4, lines 47-63 and column 5, line 55 thru column 6, line 20).

### *Claim Rejections - 35 USC § 103*

10 The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

15 (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Walton (as cited above) in view of Harrington et al. (U.S. Patent Publication No. 2003/0236972 A1) (hereinafter referred to as Harrington).

As to claim 1, Walton discloses a method for resetting a partition of a multiple partition system, wherein the partition (see Fig. 1) comprises a plurality of processors (CPUs 302), the method comprising: executing, by one processor ("monarch" processor) of the plurality of processors, a reset code from firmware (PDH module) (Walton discloses the "monarch" processor within a cell managing booting and processor formation wherein PDH is a firmware device comprising booting code which is inclusive of initialization and reset; column 3, lines 5-

Art Unit: 2116

12 and column 5, lines 35-47); building a list (data structure called complex profile) of reset register addresses associated with the plurality of processors (Walton discloses a complex profile being created which is a “map” of the cell configuration which comprises location of devices assigned to a cell/partition which inherently would contain processor locations [addresses] and therefore register addresses; column 2, lines 7-15 and column 4, line 47 thru column 5, line 34); sending an interrupt (step 206 or 208) to the other processors of the plurality of processors (Walton discloses step 206 of Fig. 2 resetting a cell which necessitates an interrupt to the other processors of the cell upon reset. Also, Walton discloses the system “synchronizing” of cells in step 208 in Figs. 2 and 3 which also necessitates an interrupt; column 6, line 47 thru column 7, line 11); resetting the other processors (via CM 304) by writing a reset code to their associated reset registers (state register(s) associated with the cells) (column 4, lines 47-63 and column 5, line 55 thru column 6, line 20).

Walton fails to explicitly disclose resetting the one processor by writing to its associated reset register.

15 Harrington teaches a partitioned system wherein one processor of the partition (step 520 of Fig. 5) to process a warm reboot request (which sends out reset signals and interrupts to all of the other partition processors; paragraph 23 and paragraph 12) and then pass the control over to a service processor (135) to reset *all* of the processors in the partition and continue with the warm reboot (paragraphs 51 and 52). Therefore, the “one processor” of the partition resets all of the other processors and then a service processor (135) resets all of the processors to include the “one processor.” Walton also teaches the system creating a list of resources (locating the resources) which is maintained by the system firmware (paragraph 4). Walton has the additional

Art Unit: 2116

benefit of having a more reliable reboot process in a partition system ensuring all pending I/O requests within the system are halted/completed (paragraphs 12 and 13).

It would have been obvious to one of ordinary skill of the art having the teachings of Walton and Harrington at the time the invention was made, to modify method of Walton to include the step of resetting the one processor as taught by Harrington. One of ordinary skill in the art would be motivated to make this combination of including the step of resetting the one processor after resetting all of the other processors in the partition in view of the teachings of Harrington, as doing so would give the added benefit of having a more reliable reboot process in a partition system ensuring all pending I/O requests within the system are halted/completed (as taught by Harrington above).

As to claim 2, Walton in combination with Harrington taught the method in claim 1, as shown above. Walton further teaches the method further comprising: storing the firmware on a read only memory (column 3, lines 5-12).

As to claim 3, Walton in combination with Harrington taught the method in claim 1, as shown above. Walton further teaches the method further comprising: storing the list of reset register addresses in random access memory ("caching" the complex profile within the CM 304; column 4, line 47 thru column 5, line 34).

As to claim 5, Walton in combination with Harrington taught the method in claim 1, as shown above. Harrington further teaches the method further comprising: requesting the execution of the reset code by a processor of the plurality of processors (paragraph 50).

As to claim 6, Walton in combination with Harrington taught the method in claim 1, as shown above. Harrington further teaches the method further comprising: requesting the

Art Unit: 2116

execution of the reset code by an operating system of the multiple partition system (paragraphs 50 and 51).

As to claim 7, Walton in combination with Harrington taught the method in claim 1, as shown above. Harrington further teaches the method further comprising: requesting the  
5 execution of the reset code by a firmware shell (hypervisor) of the multiple partition system (RTAS of hypervisor; paragraphs 42, 45 and 50).

As to claim 9, Walton in combination with Harrington taught the method in claim 1, as shown above. Harrington further teaches the method further comprising: flushing a cache associated with the one processor, after sending the interrupt (resetting all of the processors in  
10 the partition after running RTAS necessitates flushing the cache of the one processor; paragraphs 23, 50 and 51).

As to claim 10, Walton in combination with Harrington taught the method in claim 1, as shown above. Harrington further teaches the method further comprising: moving execution from main memory to read only memory (from the operating system to the hypervisor; paragraph 51).

15 As to claim 12, Walton in combination with Harrington taught the method in claim 1, as shown above. Walton further teaches the method wherein the partition comprises a plurality of cells, and each cell comprises at least one processor, the method further comprises: inventorying (updating the complex profile) the plurality of cells for resetting (column 5, lines 23-34).

As to claim 13, Walton in combination with Harrington taught the method in claim 1, as  
20 shown above. Walton further teaches the method wherein resetting the one processor occurs after resetting the other processors (paragraphs 50 and 51).

Claim 14 is rejected under 35 U.S.C. 103(a) as being unpatentable over Walton and Harrington as applied to claim 1 above, and further in view of Applicant's Admitted Prior Art (hereinafter referred to as AAPA).

Applicant has admitted in the Background of the Invention that cells in a partition include  
5 Itanium Processor Family chips (paragraph 2).

Claim 21 is rejected under 35 U.S.C. 103(a) as being unpatentable over Walton as applied to claim 15 above, and further in view of Harrington (as cited above).

As to claims 21, Walton fails to explicitly disclose the partition wherein the one processor is reset after the other processors of the plurality of processors are reset.

10 Harrington teaches a partitioned system wherein one processor of the partition (step 520 of Fig. 5) to process a warm reboot request (which sends out reset signals and interrupts to all of the other partition processors; paragraph 23 and paragraph 12) and then pass the control over to a service processor (135) to reset *all* of the processors in the partition and continue with the warm  
15 reboot (paragraphs 51 and 52). Therefore, the "one processor" of the partition resets all of the other processors and then a service processor (135) resets all of the processors to include the "one processor." Walton also teaches the system creating a list of resources (locating the resources) which is maintained by the system firmware (paragraph 4). Walton has the additional benefit of having a more reliable reboot process in a partition system ensuring all pending I/O requests within the system are halted/completed (paragraphs 12 and 13).

20 It would have been obvious to one of ordinary skill of the art having the teachings of Walton and Harrington at the time the invention was made, to modify method of Walton to include the step of resetting the one processor as taught by Harrington. One of ordinary skill in

Art Unit: 2116

the art would be motivated to make this combination of including the step of resetting the one processor after resetting all of the other processors in the partition in view of the teachings of Harrington, as doing so would give the added benefit of having a more reliable reboot process in a partition system ensuring all pending I/O requests within the system are halted/completed (as taught by Harrington above).

Claim 22 is rejected under 35 U.S.C. 103(a) as being unpatentable over Walton as applied to claim 15 above, and further in view of Applicant's Admitted Prior Art (hereinafter referred to as AAPA).

Applicant has admitted in the Background of the Invention that cells in a partition include Itanium Processor Family chips (paragraph 2).

#### *Allowable Subject Matter*

Claims 4, 8 and 11 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is a statement of reasons for the indication of allowable subject matter: the limitation(s) found within these claims could not be found in further Examiner's search.

***Response to Arguments***

Applicant's arguments, see REMARKS, filed September 1, 2006, with respect to the rejection(s) of claim(s) 1-14 under 35 USC § 103 have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, upon further consideration, a new ground(s) of rejection is made in view of 35 USC § 103 over Walton (as cited above) in view of Harrington (as cited above).

Likewise, arguments with respect to rejection(s) of claim 15 and 23 under 35 USC § 103 have been fully considered and are persuasive. However, upon further consideration, a new ground(s) of rejection is made in view of 35 USC § 102 as being anticipated by Walton.

10

***Conclusion***

Any inquiry concerning this communication or earlier communications from the Examiner should be directed to James Sugent whose telephone number is (571) 272-5726. The Examiner can normally be reached on 8AM - 4PM.

15

If attempts to reach the Examiner by telephone are unsuccessful, the Examiner's supervisor, Rehana Perveen can be reached on (571) 272-3676. The fax phone number for the organization where this application or proceeding is assigned is (571) 273-8300.

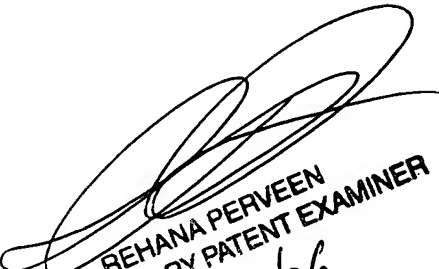

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
